ENERGY STAR®

Version 3.0 Computer Servers
Draft 3 Specification Webinar

U.S. Environmental Protection Agency
May 17, 2018

Introductions

- Ryan Fogle – EPA, Computer Servers Product Lead
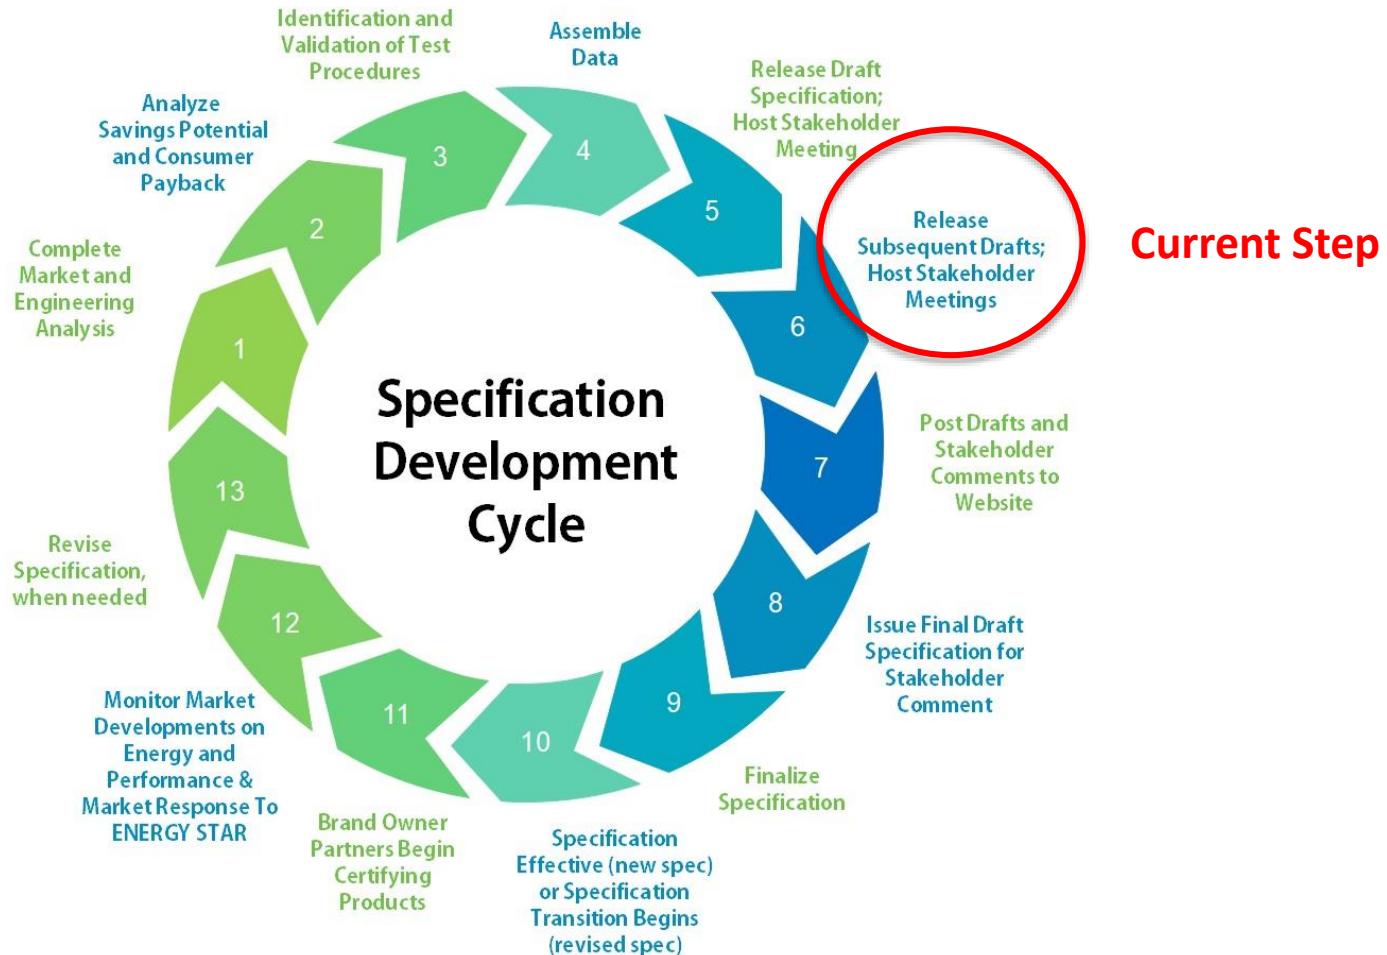

- John Clinger – ICF

Outline

- Overview
    - Specification Development Cycle
    - Summary of Draft 3 Proposal
- Definitions
- Active State Efficiency Criteria
- Idle State Reporting
- Other Testing Criteria
- Timeline & Next Steps

Review of Specification Development Cycle

Summary of Draft 3 Proposals

- Proposed more aggressive active only requirements.

- Amended idle requirements to reporting only and removed the manual test measurement.

- Updated APA requirements.

Definitions

- Resilient Server
  - Definition based on stakeholder feedback.
  - Incorporates language directly into the Definitions section of the specification and removes Appendix B from the specification.
- High Performance Computing System (HPC)
  - Minor edits made to address recent advancements in the HPC market.
- Product Family Tested Configurations:
  - Updated the definition to provide additional clarity and increase the consistency of system configurations within each product testing configuration.

Active State Efficiency - Threshold

- ENERGY STAR utilized SERT V2.0.0 data points.
    - Incorporates newer, more modern reference server.
    - Reduced the values by as much as 5x compared to SERT V1.1.1

- With the removal of idle requirements, EPA increased the stringency of the active requirements to differentiate the top quartile of the market.
    - Includes new chipsets as well as current chipsets expected to be sold over the lifetime of the specification.

- Analyzed projected pass rates at both configuration and product family based, separated by form factor (rack, blade, tower, resilient) and socket count (1, 2, 4).

- All ENERGY STAR products will have to meet their applicable minimum Eff_{ACTIVE} values shown in Table 3 to certify as ENERGY STAR.

Active State Efficiency - Threshold

Table 3: Active State Efficiency Thresholds for all Computer Servers

Product Type	Minimum Eff_{ACTIVE}
One Installed Processor	
Rack	11.0
Tower	9.4
Blade or Multi-Node	9.0
Resilient	4.8
Two Installed Processors	
Rack	13.0
Tower	12.0
Blade or Multi-Node	14.0
Resilient	5.2
Greater Than Two Installed Processors	
Rack	16.0
Blade or Multi-Node	9.6
Resilient	4.2

Pass Rates by Product Category

Product Type	ES Pass Rate	Total Product Count
One Installed Processor		
Rack	33%	9
Tower*	29%	7
Blade or Multi-Node	40%	5
Resilient	100%	1
Two Installed Processors		
Rack	24%	33
Tower	40%	5
Blade or Multi-Node	24%	17
Resilient	33%	3
Greater Than Two Installed Processors		
Rack	29%	7
Blade or Multi-Node	33%	9
Resilient*	33%	3

*All data prior to 2014 was included because 2014+ only data was not sufficeint to set a level

Active State Efficiency – Analysis Observations

- EPA found that pass rates in the dataset were at least 24%.

  - Includes models between 2014 and November 2017.

    - Exceptions:

      - One socket tower products.

      - Greater than two socket resilient servers

- Data reviewed by the Agency, indicated that 11 product categories were necessary to adequately differentiate computer servers with varying performance levels and architectures.

Idle State Reporting

- EPA has maintained idle state reporting for Version 3.0.

  – Two sections were removed from the specification (Sections 3.7 and 3.8 in Draft 2).

  – The manual idle measurement test was also removed from the test method.

    • Only the SERT idle test will be required for reporting.

Other Testing Criteria

- APA Requirements:

  - EPA received feedback from several stakeholders showing that there are multiple divergent APA technologies developing which require higher idle power consumption, but also provide much greater processing capability.

  - However, an apple to apple comparison of different memory bandwidth and performance options is not feasible at this time.

    - E.g. GPGPUs vs. FPGAs

  - With the lack of a test method, EPA is proposing that all servers be tested without expansion APAs installed during test and that manufacturers report the APA details and idle power consumption.

Any Questions?

Draft 3 Specification Comment Deadline

- Please send written feedback to servers@energystar.gov

Comment Deadline
Monday, June 4, 2018

Thank You!
